

Lab_Summary

SQL & MQL Functions – Complete Reference

Table of Contents

1. Oracle SQL Functions
 - String Functions
 - Numeric Functions
 - Date Functions
 - Conversion Functions
 - Aggregate Functions
 - Window Functions
 - Conditional Functions
2. MongoDB MQL Functions
 - Basic Query Methods
 - Update Operators
 - Aggregation Stage Operators
 - Aggregation Accumulators
 - Comparison Operators
 - Boolean Operators
 - Array Operators
 - String Operators
 - Arithmetic Operators
 - Conditional Operators
 - Set Operators
 - Date Operators
 - System Variables

Oracle SQL Functions

String Functions

Function	Purpose	Example
<code>lower(string)</code>	Converts string to lowercase	<code>select low</code>
<code>upper(string)</code>	Converts string to uppercase	<code>select upp</code>
<code>initcap(string)</code>	Capitalises first letter of each word	<code>select ini</code>
<code>substr(string, pos, length)</code>	Returns substring from position	<code>select sub</code>
<code>concat(string1, string2)</code>	Concatenates two strings	<code>select con</code>
<code>instr(string1, string2)</code>	Returns position of string2 in string1	<code>select ins</code>
<code>length(string)</code>	Returns length of string	<code>select len</code>
<code>lpad(string1, length, string2)</code>	Left-pads string1 with string2 to given length	<code>select lpa</code>
<code>rpad(string1, length, string2)</code>	Right-pads string1 with string2 to given length	<code>select rpa</code>
<code>ltrim(string)</code>	Removes leading spaces	<code>select ltr</code>
<code>rtrim(string)</code>	Removes trailing spaces	<code>select rtr</code>
<code>regexp_like(attr, pattern, opt)</code>	Matches regular expression (e.g., i for case-insensitive)	<code>regexp_lik</code>

Numeric Functions

Function	Purpose	Example
<code>abs(number)</code>	Absolute value	<code>select abs(-5) from dual;</code>
<code>ceil(number)</code>	Smallest integer number	<code>select ceil(3.14) from dual;</code>
<code>floor(number)</code>	Largest integer number	<code>select floor(3.14) from dual;</code>
<code>mod(number1, number2)</code>	Remainder (modulo)	<code>select mod(10, 3) from dual;</code>
<code>power(number1, number2)</code>	Raises number1 to number2	<code>select power(2, 3) from dual;</code>
<code>round(number1, number2)</code>	Rounds to number2 decimal places	<code>select round(3.14159, 2) from dual;</code>
<code>trunc(number1, number2)</code>	Truncates to number2 decimal places	<code>select trunc(3.14159, 2) from dual;</code>

Date Functions

Function	Purpose	Example
<code>add_months(date, number)</code>	Adds months to date	<code>select add_months(sysdate, 3)</code>
<code>next_day(date, weekday)</code>	Returns next occurrence of weekday	<code>select next_day(sysdate, 'MON')</code>
<code>last_day(date)</code>	Returns last day of the month	<code>select last_day(sysdate) from dual;</code>
<code>current_date / sysdate</code>	Returns current date/time	<code>select current_date from dual;</code>
<code>months_between(date1, date2)</code>	Months between two dates	<code>select months_between(sysdate, sysdate + 1)</code>
<code>new_time(date, zone1, zone2)</code>	Converts time zone	<code>select new_time(sysdate, 'EST', 'GMT')</code>
<code>to_date(string, format)</code>	Converts string to date	<code>select to_date('20 MAR 2026', 'DD MON YYYY')</code>
<code>to_char(date, format_mask)</code>	Converts date to formatted string	<code>select to_char(sysdate, 'yyyy-mm-dd')</code>

Conversion Functions

Function	Purpose	Example
<code>to_char(date, format_mask)</code>	Date to string	<code>select to_char(sysdate, 'MM/DD/YY')</code>
<code>to_date(string, date_format)</code>	String to date	<code>select to_date('20 MAR 2026', 'DD MON YYYY')</code>
<code>to_number(string, format)</code>	String to number	<code>select to_number('123.45', '999.99')</code>
<code>coalesce(arg1, arg2, ...)</code>	First non-null argument	<code>select coalesce(cga, 0) from Student;</code>
<code>nvl(arg1, arg2)</code>	Returns arg2 if arg1 is null	<code>select nvl(cga, 0) from Student;</code>
<code>decode(expr, search1, result1, ...)</code>	Case-like conditional	<code>select decode(unitId, 'COMP', 'CS', 'OTHER', 'Other')</code>

Aggregate Functions

All aggregate functions ignore NULL except `count(*)`.

Function	Purpose	Example
<code>avg(attr)</code>	Average of values	<code>select avg(cga) from Student;</code>
<code>count(attr)</code>	Number of non-null values	<code>select count(studentId) from Student;</code>
<code>max(attr)</code>	Maximum value	<code>select max(cga) from Student;</code>
<code>min(attr)</code>	Minimum value	<code>select min(cga) from Student;</code>
<code>stddev(attr)</code>	Sample standard deviation	<code>select stddev(cga) from Student;</code>
<code>sum(attr)</code>	Sum of values	<code>select sum(cga) from Student;</code>

Window Functions

Aggregate Window Functions

Function	Purpose
<code>avg(expression) OVER (window)</code>	Average per partition/window
<code>count(*) OVER (window)</code>	Count per partition
<code>max(expression) OVER (window)</code>	Maximum per partition
<code>min(expression) OVER (window)</code>	Minimum per partition
<code>sum(expression) OVER (window)</code>	Sum per partition

Value Functions

Function	Purpose
<code>first_value(expression) OVER (window)</code>	Value of first row in window frame
<code>last_value(expression) OVER (window)</code>	Value of last row in window frame
<code>lag(expression, offset, default) OVER (window)</code>	Row n rows before current
<code>lead(expression, offset, default) OVER (window)</code>	Row n rows after current
<code>nth_value(expression, n) OVER (window)</code>	Value of nth row in window frame

Ranking Functions

Function	Purpose
<code>row_number() OVER (window)</code>	Sequential row number (1-based)
<code>rank() OVER (window)</code>	Rank with gaps for ties
<code>dense_rank() OVER (window)</code>	Rank without gaps
<code>ntile(n) OVER (window)</code>	Divides into n buckets
<code>percent_rank() OVER (window)</code>	Percentile rank in [0,1]
<code>cume_dist() OVER (window)</code>	Cumulative distribution

Window Clause Syntax

```
<window_function> OVER (  
    PARTITION BY column1, column2, ...  
    ORDER BY column1 [ASC|DESC], ...  
)
```
